

# Gephi Tutorial Layouts

- \* Introduction
- \* Install plugins
- \* Import file
- \* Run
- \* Choice
- \* ForceAtlas
- \* Fruchterman-Reingold
- \* YifanHu Multilevel
- \* OpenOrd
- \* ForceAtlas 2
- \* Circular Layout
- \* Radial Axis Layout
- \* Geographic map
- \* Node overlapping
- \* Geometric transform
- \* Save
- \* Conclusion

Welcome to this advanced tutorial. It will teach you the fine art of network layout in Gephi: how to use algorithms that place the nodes inside the graphic space.

Gephi version 0.8alpha was used to do this tutorial.

 [Get Gephi](#)

# Install layout plugins

We need to install additional plugins.

- Go to the Tools menu and then Plugins.
- In the Available Plugins tab check:
  - OpenOrdLayout
  - CircularLayout
  - GeoLayout
  - Geometric Transformation
  - NoverlapLayout
- Click on Install. The plugins are installed and you are asked to reboot Gephi. Click OK.

- \* Introduction
- \* Install plugins
- \* Import file
- \* Run
- \* Choice
- \* ForceAtlas
- \* Fruchterman-Reingold
- \* YifanHu Multilevel
- \* OpenOrd
- \* ForceAtlas 2
- \* Circular Layout
- \* Radial Axis Layout
- \* Geographic map
- \* Node overlapping
- \* Geometric transform
- \* Save
- \* Conclusion

# Open Graph File

- Download the file  LesMiserables.gexf
- In the menubar, go to File Menu and Open...
- When your file is opened, the report sums up data found and any issues.
  - Number of nodes
  - Number of edges
  - Type of graph
- Click on OK to validate and see the graph.

## Graph Format

- GEXF
- GraphML
- Pajek NET
- GDF
- GML
- Tulip TLP
- CSV
- Netdraw VNA
- Compressed ZIP/GZ

- \* Introduction
- \* Install plugins
- \* Import file
- \* Run
- \* Choice
- \* ForceAtlas
- \* Fruchterman-Reingold
- \* YifanHu Multilevel
- \* OpenOrd
- \* ForceAtlas 2
- \* Circular Layout
- \* Radial Axis Layout
- \* Geographic map
- \* Node overlapping
- \* Geometric transform
- \* Save
- \* Conclusion

## You should now see a graph

We imported the “Les Miserables” dataset<sup>1</sup>. This is a coappearance weighted network of characters in the novel “Les Miserables” from Victor Hugo.

Node position is random at first, so you may see a slightly different representation.

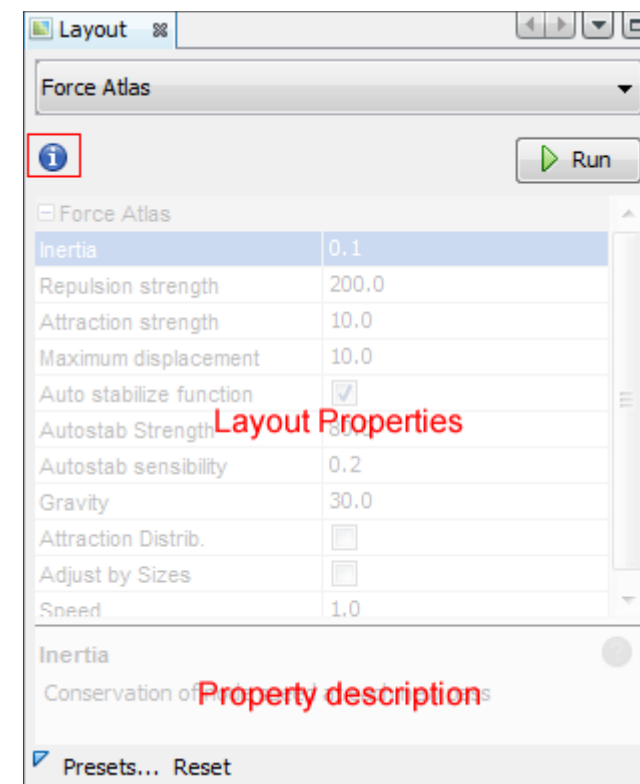

<sup>1</sup> D. E. Knuth, The Stanford GraphBase: A Platform for Combinatorial Computing, Addison-Wesley, Reading, MA (1993).

- \* Introduction
- \* Install plugins
- \* Import file
- \* **Run**
- \* Choice
- \* ForceAtlas
- \* Fruchterman-Reingold
- \* YifanHu Multilevel
- \* OpenOrd
- \* ForceAtlas 2
- \* Circular Layout
- \* Radial Axis Layout
- \* Geographic map
- \* Node overlapping
- \* Geometric transform
- \* Save
- \* Conclusion

## Run a layout

Layout algorithms set the graph shape, it is the most essential operation.

- Locate the  Layout module, on the left panel.

- Choose “Force Atlas”

You can see the layout properties below, leave default values.

- Click on  to launch the algorithm.
- You see now the positions of nodes changing in real time.

### Layout algorithms

Graphs are usually laid out with “Force-based” algorithms. They follow a simple principle: linked nodes attract each other and non-linked nodes are pushed apart.

- \* Introduction
- \* Install plugins
- \* Import file
- \* **Run**
- \* Choice
- \* ForceAtlas
- \* Fruchterman-Reingold
- \* YifanHu Multilevel
- \* OpenOrd
- \* ForceAtlas 2
- \* Circular Layout
- \* Radial Axis Layout
- \* Geographic map
- \* Node overlapping
- \* Geometric transform
- \* Save
- \* Conclusion

## Control the layout

The purpose of Layout Properties is to let you control the algorithm in order to make a readable representation.

Force Atlas	
Inertia	0.1
Repulsion strength	10000.0
Attraction strength	10.0
Maximum displacement	10.0
Auto stabilize function	<input checked="" type="checkbox"/>
Autostab Strength	80.0
Autostab sensibility	0.2
Gravity	30.0
Attraction Distrib.	<input type="checkbox"/>
Adjust by Sizes	<input type="checkbox"/>
Speed	1.0

- Set the “Repulsion strength” at 10 000 to expand the graph.
- Type “Enter” to validate the changed value.

- And now  the algorithm.

### Tips

Click on the icon  “Center on Graph” on the bottom left of the Visualization panel if you don’t see the graph anymore.

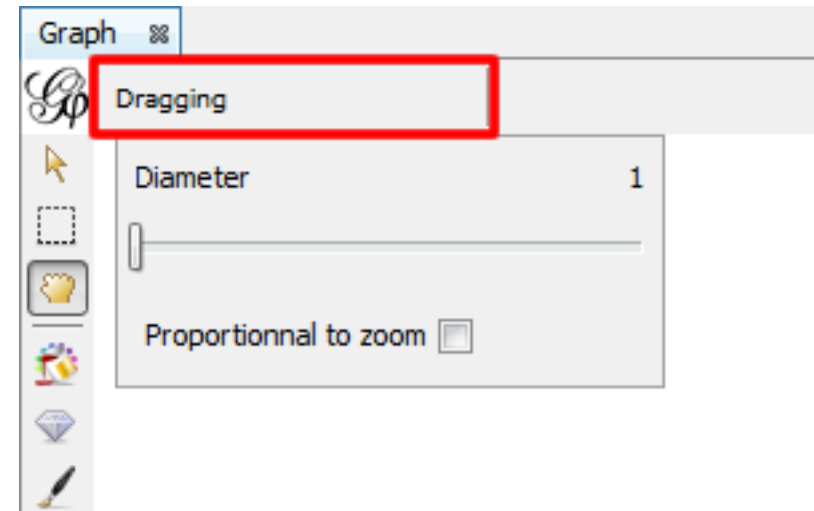

You should now see a graph with the layout applied

- \* Introduction
- \* Install plugins
- \* Import file
- \* **Run**
- \* Choice
- \* ForceAtlas
- \* Fruchterman-Reingold
- \* YifanHu Multilevel
- \* OpenOrd
- \* ForceAtlas 2
- \* Circular Layout
- \* Radial Axis Layout
- \* Geographic map
- \* Node overlapping
- \* Geometric transform
- \* Save
- \* Conclusion

# Play against the algorithm!

Run the layout again and drag the nodes to stress it.

- Locate  Dragging action, in the top left of the Visualization panel.
- Adjust the selection diameter in the panel or by using the shortcut “Ctrl + Mouse Wheel”.

Increase the “Autostab strength” in the Layout Properties to 100 000, then drag the nodes. The graph becomes less deformed.

- And now  the algorithm.

- \* Introduction
- \* Install plugins
- \* Import file
- \* **Run**
- \* Choice
- \* ForceAtlas
- \* Fruchterman-Reingold
- \* YifanHu Multilevel
- \* OpenOrd
- \* ForceAtlas 2
- \* Circular Layout
- \* Radial Axis Layout
- \* Geographic map
- \* Node overlapping
- \* Geometric transform
- \* Save
- \* Conclusion

## Various layouts exist

Gephi implements various layout algorithms. They set the shape of the graph.

*OpenOrd*

*ForceAtlas 2*

*Radial Axis*

*GeoLayout*

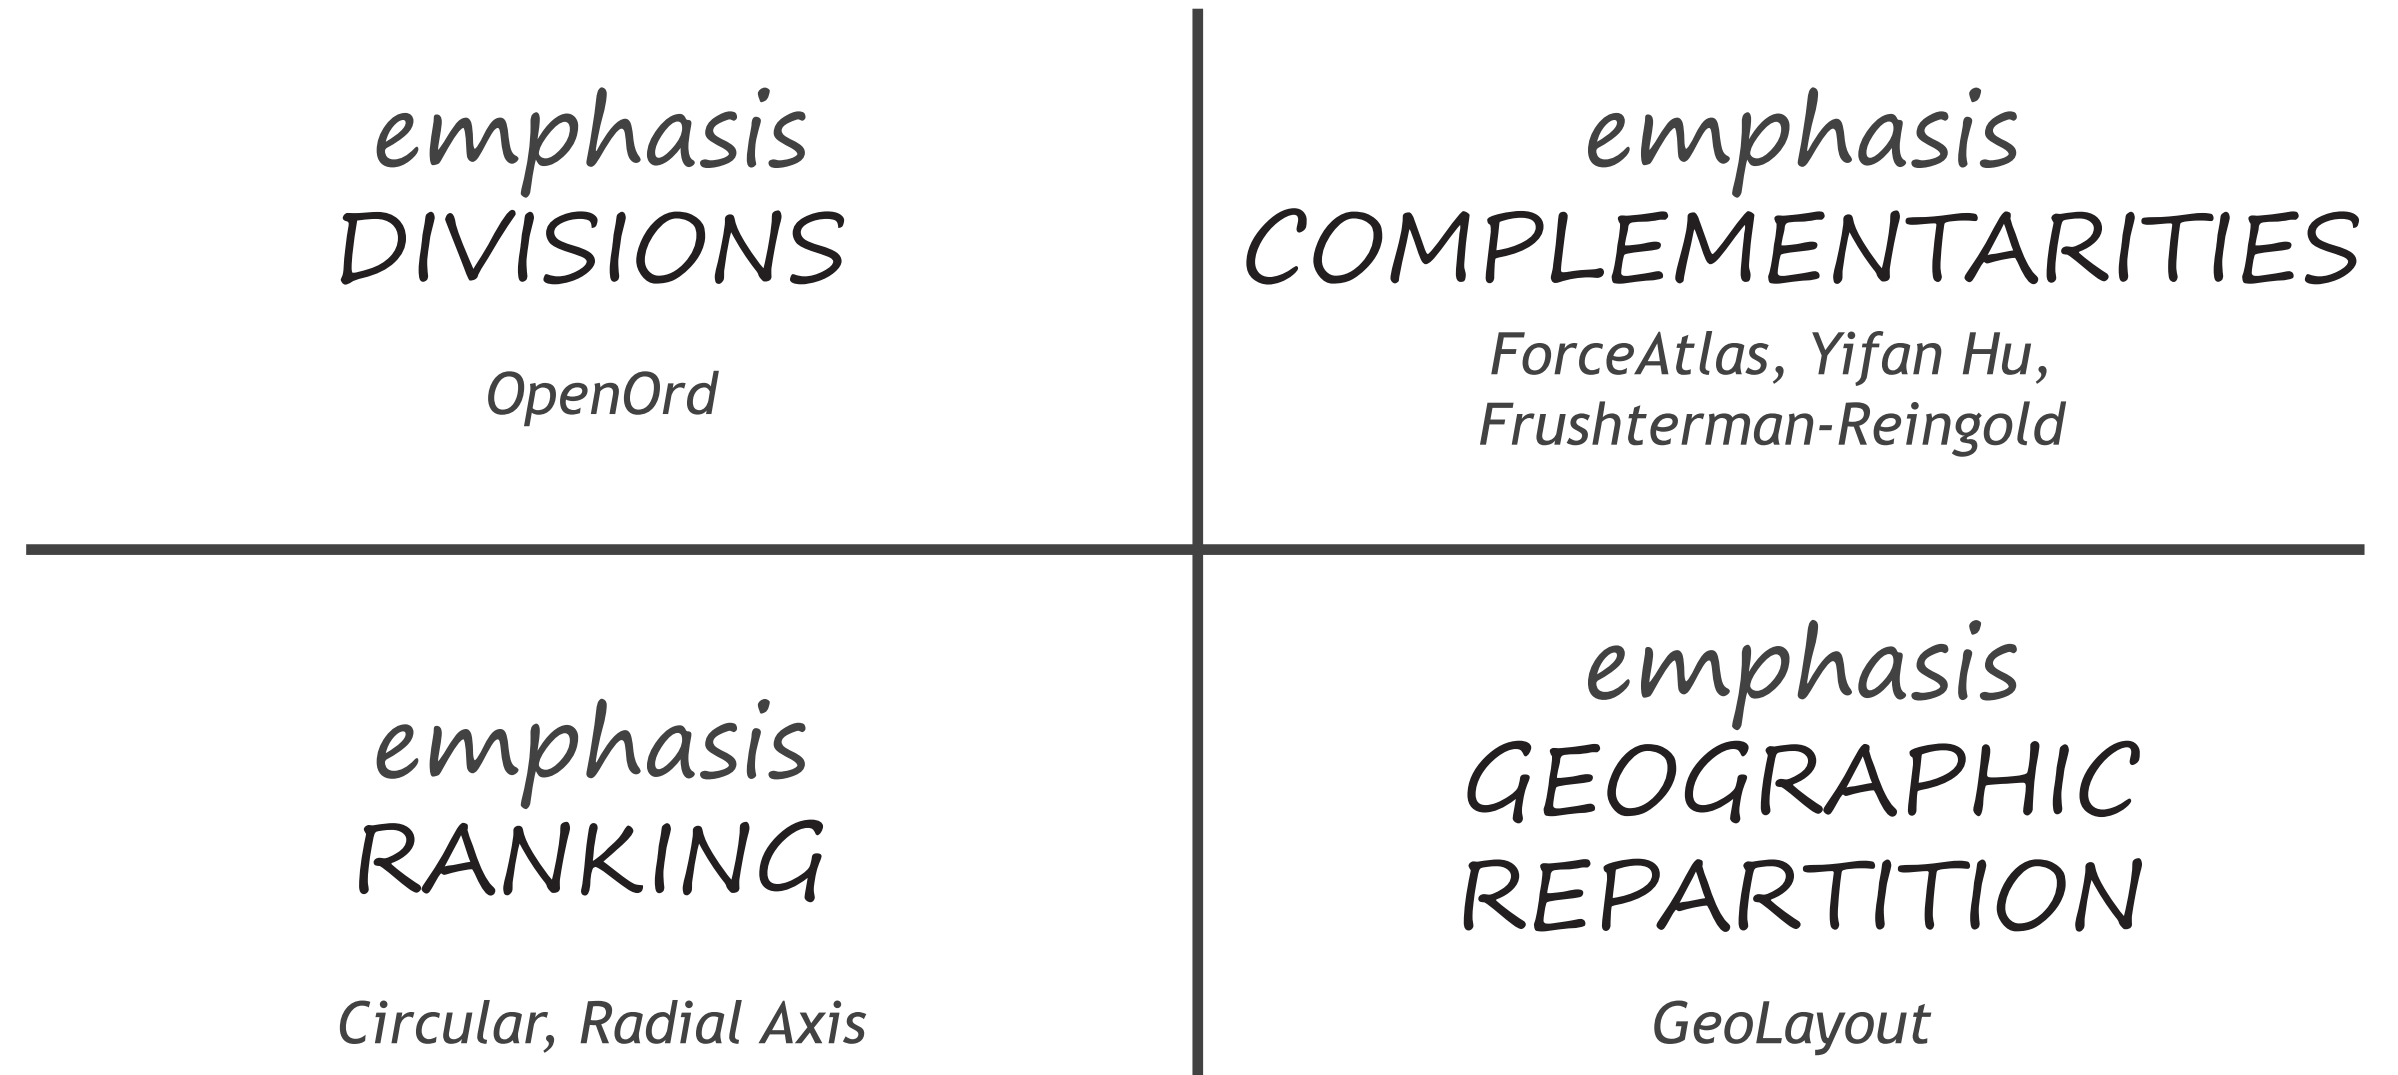

Airlines sample dataset: <http://gephi.org/datasets/airlines-sample.gexf>

- \* Introduction
- \* Install plugins
- \* Import file
- \* Run
- \* Choice
- \* ForceAtlas
- \* Fruchterman-Reingold
- \* YifanHu Multilevel

- \* ForceAtlas 2
- \* Circular Layout
- \* Radial Axis Layout
- \* Geographic map
- \* Node overlapping
- \* Geometric transform
- \* Save
- \* Conclusion

# ForceAtlas layout

Home-brew layout of Gephi, it is made to spatialize Small-World / Scale-free networks. It is focused on quality (meaning “being useful to explore real data”) to allow a rigorous interpretation of the graph (e.g. in SNA) with the fewest biases possible, and a good readability even if it is slow.

Author:	Mathieu Jacomy
Date:	2007
Kind:	Force-directed
Complexity:	$O(N^2)$
Graph size:	1 to 10 000 nodes
Use edge weight:	Yes

- \* Introduction
- \* Install plugins
- \* Import file
- \* Run
- \* Choice
- \* **ForceAtlas**

- \* Geographic map
- \* Node overlapping
- \* Geometric transform
- \* Save
- \* Conclusion

## Run ForceAtlas

the layout by applying the following settings step by step:

- Autostab strength = 2 000      Increase to move the nodes slowly.
- Repulsion strength = 1 000      How strongly does each node reject others.
- Attraction strength = 1      How strongly each pair of connected nodes attract each other.
- Gravity = 100      Attract all nodes to the center to avoid dispersion of disconnected components.
- Attraction Distrib. = checked      Push hubs (high number of output links) at the periphery and put authorities (high number of input links) more central.

And now  the algorithm.

### Adjust by Sizes

This option avoids node overlapping, depending on the size of each node.

# Fruchterman-Reingold layout

It simulates the graph as a system of mass particles. The nodes are the mass particles and the edges are springs between the particles. The algorithms try to minimize the energy of this physical system. It has become a standard but remains very slow.

Author:	Thomas Fruchterman & Edward Reingold <sup>1</sup>
Date:	1991
Kind:	Force-directed
Complexity:	$O(N^2)$
Graph size:	1 to 1 000 nodes
Use edge weight:	No

<sup>1</sup> Fruchterman, T. M. J., & Reingold, E. M. (1991). Graph Drawing by Force-Directed Placement. Software: Practice and Experience, 21(11).

- \* Save
- \* Conclusion

## Run Fruchterman-Reingold

the layout by applying the following settings step by step:

- Area = 100
- Area = 100 000

Graph size area.

- Gravity = 1 000
- Gravity = 100

Attract all nodes to the center to avoid dispersion of disconnected components.

And now  the algorithm.

### Unstable nodes position!

Sometimes the algorithm does not converge, resulting in an unstable graph. Reduce the “Speed” setting to gain precision.

## Yifan Hu Multilevel layout

It is a very fast algorithm with a good quality on large graphs. It combines a force-directed model with a graph coarsening technique (multilevel algorithm) to reduce the complexity. The repulsive forces on one node from a cluster of distant nodes are approximated by a Barnes-Hut calculation, which treats them as one super-node. It stops automatically.

Author:	Yifan Hu <sup>1</sup>
Date:	2005
Kind:	Force-directed + multilevel
Complexity:	$O(N \cdot \log(N))$
Graph size:	100 to 100 000 nodes
Use edge weight:	No

<sup>1</sup> Y. F. Hu, Efficient and high quality force-directed graph drawing. The Mathematica Journal, 10 (37-71), 2005.

## OpenOrd layout

It expects undirected weighted graphs and aims to better distinguish **clusters**. It can be run in parallel to speed up computing, and stops automatically. The algorithm is originally based on Fruchterman-Reingold and works with a fixed number of iterations controlled via a simulated annealing type schedule (liquid, expansion, cool-down, crunch, and simmer). Long edges are cut to allow clusters to separate.

Author:	S. Martin, W. M. Brown, R. Klavans, and K. Boyack <sup>1</sup>
Date:	2010 (VxOrd)
Kind:	Force-directed + simulated annealing
Complexity:	$O(N \cdot \log(N))$
Graph size:	100 to 1 000 000 nodes
Use edge weight:	Yes

- \* Save
- \* Conclusion

## Run OpenOrd

Launch the layout by applying the following settings step by step:

- Edge cut = 0.95

From 0 (standard Fruchterman-Reingold) to 1. Percentage of the greatest distance between two nodes in the drawing. A higher cutting means a more clustered result.

- Num iterations = 100
- Num iterations = 850

Contract the clusters.  
Expand the clusters.

- Random seed =  
-6308261588084905834

Use this value to produce exactly the same shape as shown before.

### Fix node placement

Fix the position of a node (or a group of selected nodes) by “Right-click on it > Settle”. It works for all layouts except Yifan Hu. For OpenOrd, use the “fixed time” setting on the Layout panel to configure the time the fixed nodes will not move.

# Run OpenOrd on a large graph

OpenOrd is really helpful on large graphs.

- Import the file  internet\_routers-22july06.gml.zip

This network has 22 963 nodes and 48 436 edges. It is a symmetrized snapshot of the structure of the Internet at the level of autonomous systems, reconstructed from BGP tables posted by the University of Oregon Route Views Project. This snapshot was created by Mark Newman from data on July 22, 2006.

If you have a multi-core computer:

Increase the number of threads to execute it in parallel and therefore speed up the execution of the algorithm. It is recommended to set the number of core minus 1 to keep a thread for display.

- Set the “Num Threads” setting or leave default parameters.
- Click on  and wait until it stops.

OpenOrd executes in a finite number of iterations, so you can see the progress on the bottom-right of the screen.

## Go back to the previous workspace

When you imported the second dataset, a new workspace was automatically created. You are now in the “Workspace 2”. We go back now to the “Workspace 1” where the graph of Les Miserables still exists.

- Locate the workspace switcher on the bottom-right of the screen.
- You see the name of the current workspace.
- Click on it and select “Workspace 1”. You can either click on the arrows to switch.

## ForceAtlas 2 layout

Improved version of the Force Atlas to handle large networks while keeping a very good quality. Nodes repulsion is approximated with a Barnes-Hut calculation, which therefore reduces the algorithm complexity. Replace the “attraction” and “repulsion” forces by a “scaling” parameter.

Author:	Mathieu Jacomy <sup>1</sup>
Date:	2011
Kind:	Force-directed
Complexity:	$O(N \cdot \log(N))$
Graph size:	1 to 1 000 000 nodes
Use edge weight:	Yes

## Run ForceAtlas 2

 the layout by applying the following settings step by step:

- LinLog mode = checked  
Linear attraction & logarithmic repulsion (lin-lin by default), makes clusters tighter.
- LinLog mode = unchecked
- Scaling = 100  
Increase to make the graph sparser.
- Edge weight influence = 0  
From 0 (no influence) to 1 (normal). Set 0 to calculate forces without edge weight.

And now  the algorithm.

### Performance

Activate “Approximate Repulsion” on large graphs only, but let’s try it in this tutorial. Check it, set the “Tolerance” option to 0.04 and run the algorithm to see how nodes are swinging!

ForceAtlas 2	
	
<b>Behavior Alternatives</b>

# Radial Axis Layout

It is provided with the Circular Layout plugin. It groups nodes and draws the groups in axes (or spars) radiating outwards from a central circle. Groups are generated using a metric (degree, betweenness centrality...) or an attribute. Use it to study homophily by showing distributions of nodes inside groups with their links.

Author:	Matt Groeninger <sup>1</sup>
Date:	2011
Kind:	Circular
Complexity:	$O(N)$
Graph size:	1 to 1 000 000 nodes

## Detect communities

We now want to study the community structure in this network: does it divide naturally into groups of nodes with dense connections within groups and sparser connections between groups?

In the  Statistics panel, click on  near the “Modularity”<sup>1</sup> line.

The community detection algorithm created a “Modularity Class” value for each node. The partition module can use this new data to colorize communities.

- Locate the  Partition module on the left panel.
- Click on the “Refresh” button to populate the partition list.

- Select “Modularity Class” in the partition list.

You can see that 9 communities were found, could be different for you. A random color has been set for each community identifier.

- Click on  to colorize nodes.

<sup>1</sup> Blondel V, Guillaume J, Lambiotte R, Mech E (2008) Fast unfolding of communities in large networks. J Stat Mech: Theory Exp 2008:P10008. (<http://findcommunities.googlepages.com>)

- \* Radial Axis Layout
- \* Geographic map
- \* Node overlapping
- \* Geometric transform
- \* Save
- \* Conclusion

## Run Radial Axis Layout

Run the layout by applying the following settings step by step:

- Group nodes by = “Degree”  Homophily by degree?
- Group nodes by = “Modularity Class”  
• Order nodes by = “Degree”  Distribution of nodes by degree inside each community.
- Draw spar/axis as spiral = checked  Better show links inside communities
- Draw spar/axis as spiral = unchecked  
• Ascending order = checked  Better show links between communities

# Geographic map with GeoLayout

The GeoLayout uses latitude/longitude coordinates to set nodes position on the network. Several projections are available, including Mercator which is used by Google Maps and other online services. The two node attribute columns for coordinates should be in numeric format.

Author:	Alexis Jacomy <sup>1</sup>
Date:	2010
Kind:	Geographic
Complexity:	$O(N)$
Graph size:	1 to 1 000 000 nodes

<sup>1</sup> <http://gephi.org/2010/map-geocoded-data-with-gephi/>

- \* Conclusion

# How to avoid node overlap?

Sometimes the layout is not completely satisfying, as big nodes can overlap smaller. Three different techniques are available to avoid it.

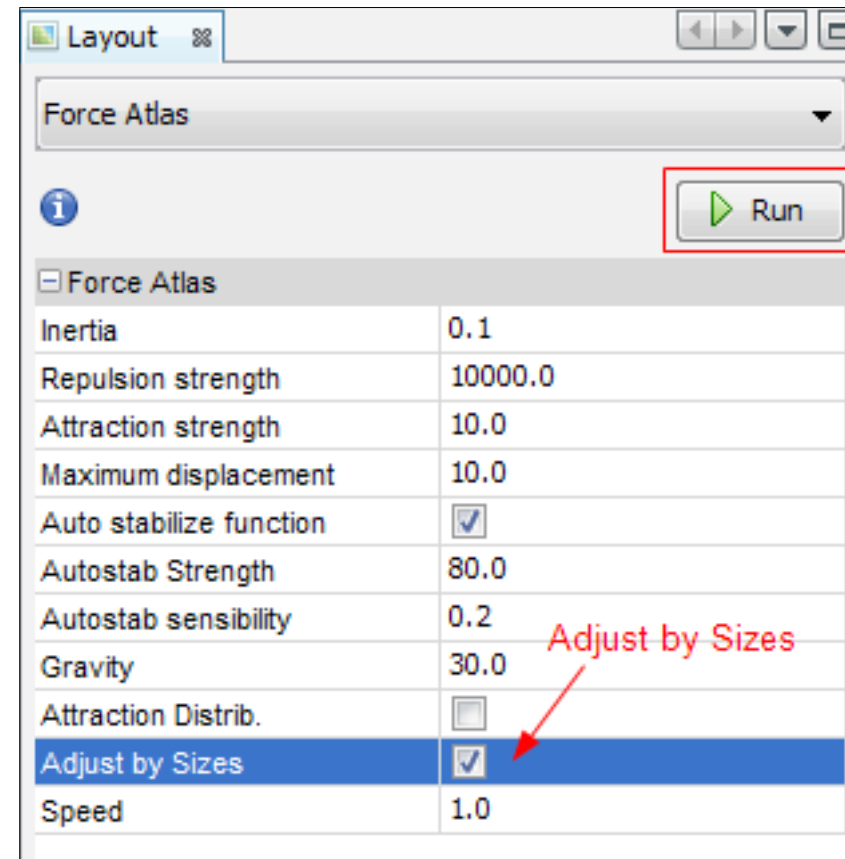

The “**Force Atlas**” algorithm has an option to take node size into account when applying a layout.

- Go back to the Workspace 1.
- Choose “Force Atlas” on the  Layout panel.
- Click on “Reset” at the bottom of the panel to reset the layout parameters.

- \* Introduction
- \* Install plugins
- \* Import file
- \* Run
- \* Choice
- \* ForceAtlas
- \* Fruchterman-Reingold
- \* YifanHu Multilevel
- \* OpenOrd
- \* ForceAtlas 2
- \* Circular Layout
- \* Radial Axis Layout
- \* Geographic map
- \* Node overlapping
- \* Geometric transform
- \* Save
- \* Conclusion

# How to avoid node overlap?

-  the algorithm.
- Check the “Adjust by Sizes” (“Prevent Overlap” in ForceAtlas 2) option and run it again for a short moment.
- Set the “Repulsion Strength” to 1 000.
- Set the “Autostab Strength” to 500.
-  the algorithm.

You can see nodes are not overlapping anymore.

## ! Instability!

This option makes node positions very unstable and disturbs the layout process. Use it at the end of the layout to refine it.

- \* Introduction
- \* Install plugins

## Noverlap layout

Use it after any layout to prevent node overlap while keeping the shape of the graph. It is optimized for big graphs.

- First, run the “YifanHu” layout.
- Select the “Noverlap” algorithm and run it until it stops.
- Reduce the “speed” setting to 0.1 to increase quality.
- Increase the “ratio” at 2 and “margin” at 10 for more spacing around nodes.

You can see nodes are not overlapping anymore.

## Label Adjust layout

It works on text size to repulse nodes and therefore makes every label readable. It only runs on the visible nodes in the Visualization panel.

- Locate the Visualization settings.
- Click on  to activate text display.
- Increase the text size to the maximum.

- Go to the  Layout panel.
- Select the “Label Adjust” algorithm and run it until it stops.

## Geometric transformations

There is no North-South-East-West directions for layouts, and distances are always relative. The same layout on the same graph can produce shapes with different orientations and scale. Transformation are sometimes useful to compare laid out graphs.

Use the following layouts to do basic transformations on the graph:

- “Clockwise Rotate” with angle  $-90^\circ$
- “Counter-Clockwise Rotate” with angle  $45^\circ$
- “Expansion” with scale factor 1.2
- “Contraction” with scale factor 0.8

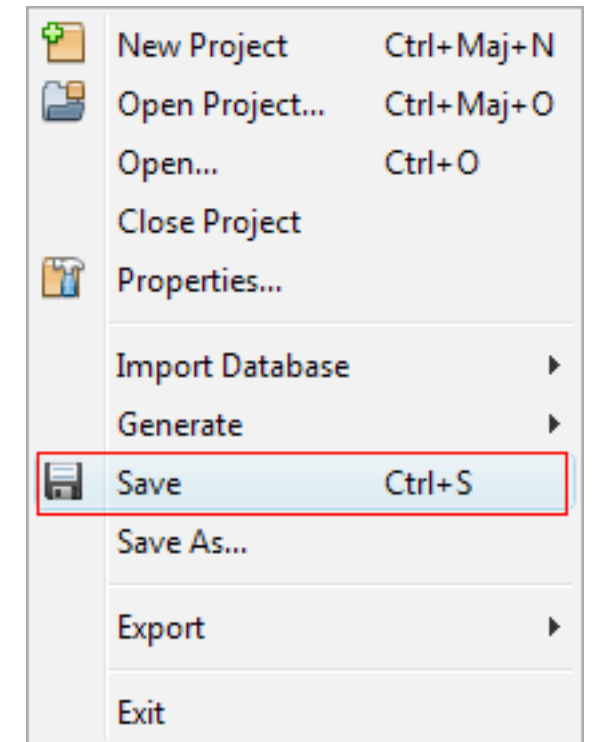

### Transformation layout

The plugin “Geometric Transformation” allows to combine rotations, homothetic transformations and translations at the same time.

- \* Geographic map
- \* Node overlapping
- \* Geometric transform
- \* **Save**
- \* Conclusion

## Save your project

Saving your project encapsulates all data and results in a single session file.

# Conclusion

In this tutorial you learned how to use various layouts in Gephi according to the feature you want to emphasis in the topology and the size of the network, how to avoid node overlapping and how to do some geometric transformations.

Other layout plugins are available through the Gephi Plugins Center.
